

SoundSculpt

Event Management Website

Jillian Bonell

N12036269

Description of site

The event management website, SoundSculpt, focuses on music and gives users the ability to find music events hosted by artists.

The purpose of my website is to allow artists to be discovered and for users to expand their music variety. This is done through the ticket booking system on the website, that's accompanied by genre and date search filters. The users are of all ages but mainly young adults and teens, as they are still developing music tastes and naturally more curious for this exploration. They are also more willing to try new experiences as if they do not end up enjoying the music; it still makes for a good social outing.

Users also have the ability to create and advertise their own music events to help give local artist's easy access to a larger demographic as well as an 'upcoming' events tab on the main page for easy discovery. Being specifically for music events, the website will uniquely feature the ability to buy a number of tickets for singular events and browse different genres of the music events available.

Description of technology context (i.e. platform):

To have this music orientated event management website being implemented through a website application, mobile application, or a desktop application, proves to have numerous advantages and disadvantages.

Website applications have the advantages of being easily accessible on both mobile and desktop, easy to update, no installation needed, and low development costs. However, there are also drawbacks which include limited customisation for the user and the developer, internet dependence, and specific to the app; it would not be able to easily access location to ensure a convenient way for users to find music events near their current location (3appes, 2024).

In contrary, mobile applications have the advantages of being increasingly used more, are convenient to use, are faster and more responsive experience, and allows offline access to the application. However, offline access is not applicable in this specific circumstance as the site focuses on finding new events through the internet, but offline access to tickets previously bought can be factored in. Other disadvantages include the hassle of installing and updates, as well as being on the more expensive side for developers.

Desktop applications are also a lot like mobile applications in its disadvantages and advantages; however they are to another degree of being more customisable, faster, easily tailored to the user, and accessible offline. However, once again it takes more resources, not always accessible to people who do not own computers and higher cost of maintenance.

Considering all of these platforms and the specific music event management system, a website application will be the most versatile and evenly suited option for user satisfaction. As "97.8% of global population accessed the internet on their smartphones" (Statista, 2025) the website gains more of a chance to increase the amount of users to browse the website, while still being able to access it on their desktop as users prefer to purchase tickets on desktops which is specific to this website (Brad Ward, 2023).

User Stories

1. Title: View concert and their locations

Story: As a user I want to view all the concerts and their locations because I want a convenient entertainment option near me

Acceptance Criteria:

- A view provides the user a list of all the concerts
- For each concert, a location and address is shown

2. Title: Check availability of tickets

Story: As a user I want to check how many tickets are left for a chosen concert because I want to buy multiple tickets for my group

Acceptance Criteria:

- For each concert, a ticket availability is provided at purchase
- User can change amount of tickets purchased, default should be 0
- The amount of tickets purchased by the user should be valid compared to the amount of tickets available

3. Title: View different ticket types

Story: As a user I want to view the different types of tickets and their prices for the best possible deal

Acceptance Criteria:

- Different ticket types are visible
- Prices for all concerts are provided

- Tickets of different types can be purchased in one transaction

4. Title: Book a ticket

Story: As a user logged in I want choose and book a concert and gain tickets. I want the booking to provide a date and receive a confirmation, so I can be sure I will have my tickets

Acceptance Criteria:

- Confirmation email should be provided with a booking reference number
- The user should be able to choose the date, the tier of ticket, and number of tickets
- The availability of tickets is validated before purchasing

5. Title: Post concert review

Story: As a user logged in I want to post a review on a previous concert that I attended as I want to share my experience of that concert.

Acceptance Criteria:

- If the user is not logged in, they should be prompted to as to be able to post a review
- A comment option is available and should have a minimum of 3 words

6. Title: Create concert event

Story: As a user logged in who hosts concerts I want to create a concert event for other users as I want to be discovered by people in my region

Acceptance Criteria:

- User should be able to enter a date, genre, ticket availability, ticket tiers, ticket prices, and a short description of concert
- Confirmation email should be sent with event reference number
- Event should be visible to other users once created

7. Title: Find concert tickets for specific date

Story: As a user I want to find concert tickets on a specific day because I need to choose between the options on one day

Acceptance Criteria:

- User should be given options for a concert on a specific date
- The date enter should be valid – not a previous day

8. Title: Find concert of a specific genre

Story: As a user I want to search through all the concerts of a specific genre as I need to choose between available options

Acceptance Criteria:

- The view should provide predetermined music genres to choose from
- A filter should be applied when the user selects it – the default is no filters

9. Title: Edit Concert details as concert owner

Story: As a logged in user who has created a concert I want to edit the price, location, availability, cancellation status, and a description of the created concert because details have changed and need the users to be informed

Acceptance Criteria:

- Owner of the concert should have access to edit all details previously entered
- Cancellation of a concert should refund ticket buyers
- Ticket buyers should be notified by email if changes have been made to their concert

10. Title: Set up user

Story: As a user I want to register and provide my name, email, phone number, set my password, so I can book tickets and post reviews

Acceptance Criteria:

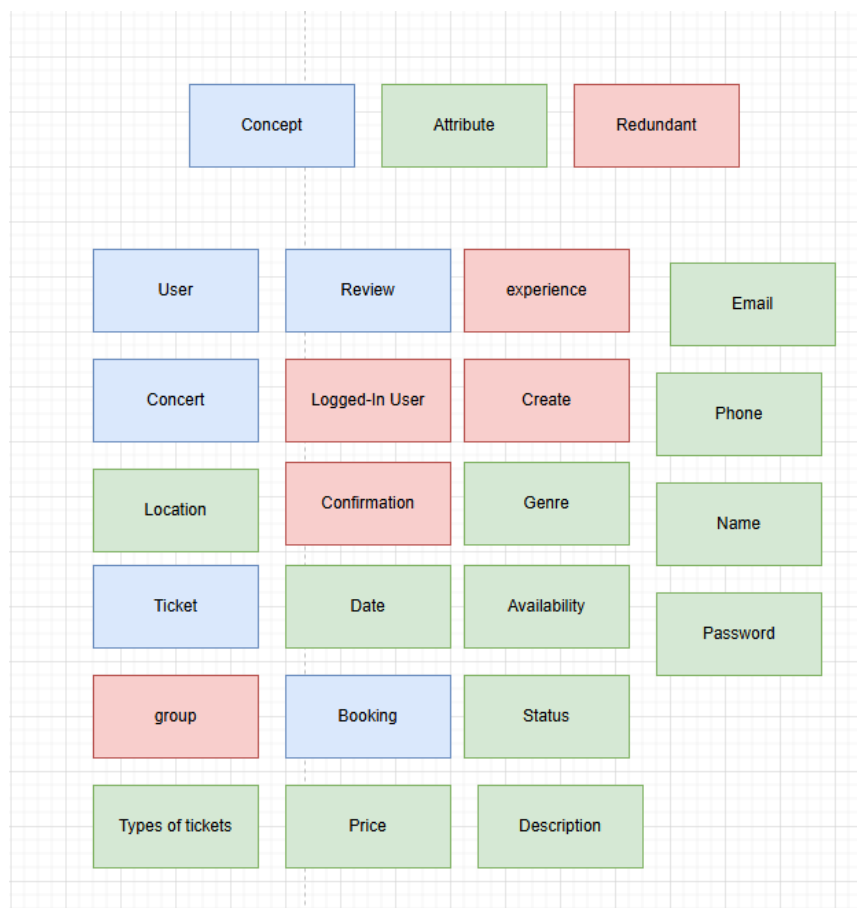

- A view should be given to enter all data boxes – all default empty
- Once account is created, it can be used to book tickets and post reviews
- User should be able to browse website logged in
- User should be able to log out

Conceptual Model:

i) List of concepts/classes from user stories

- User
- Review
- Experience
- Concert
- Logged-In User
- Create
- Location
- Confirmation
- Ticket
- Date
- Genre
- Availability
- Group
- Booking
- Status
- Types of tickets
- Price
- Description
- Email
- Phone
- Name
- Password
-

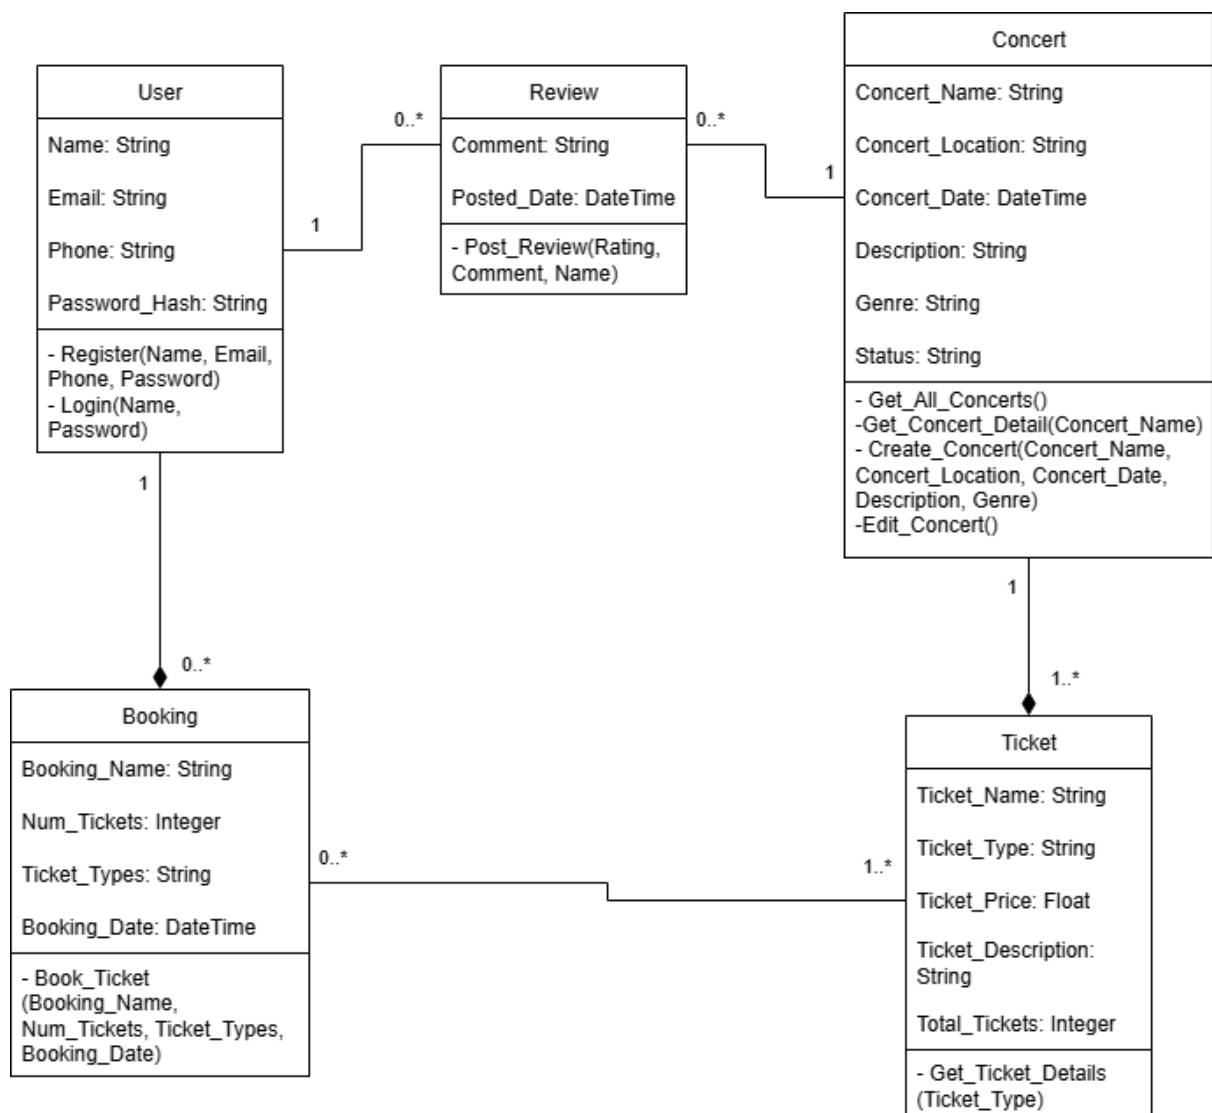

ii) Refined list of classes

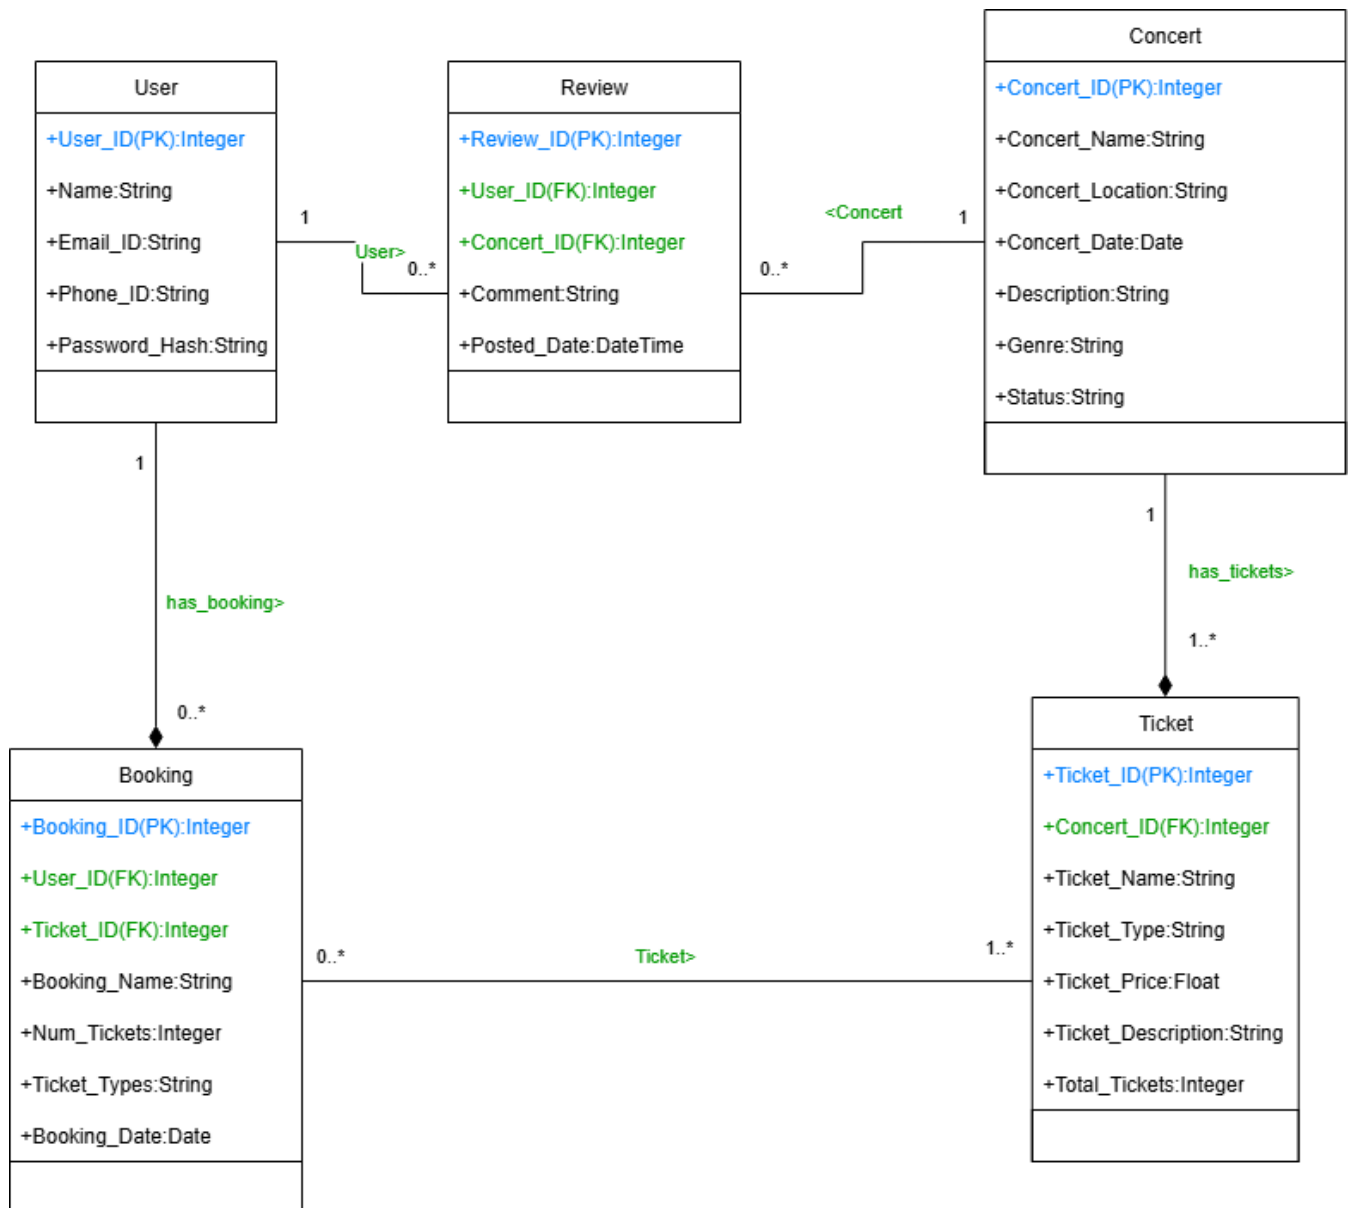

iii) List of responsibilities of class from user stories

- View concerts Concert: get all concerts
- Check and select ticket Ticket: view ticket detail
- View ticket details of a concert: view concert detail
- Book a ticket Booking: Book ticket
- User logged in User: login
- Post a review Review: post review
- Create a concert concert: create concert
- Register User User: register
- Edit concert details Concert: Edit concert

iv) Final Conceptual UML model
